

Dual-Action Forklift

Question of the day around the plant ... What do you do when your forklift won't go high enough? Well, the answer is simple enough ... you get another forklift, that's what.

Unfortunately, I don't think these guys quite understood the answer. Perhaps someone should have explained that "get another forklift" means find a forklift that *will* go high enough, not get two forklifts.

This whole scene is just insane. Not only is there a guy standing on the back of the "other" forklift, but there's a fella hanging on to the right front side operating it. *And* the equipment they're raising isn't strapped down to keep it from falling off!

Folks, I know *you're* not crazy enough to do this. And if you are, I want you to repeat the following to yourself in the mirror three times a day: "I like life. I treasure having all my limbs. My head is not as hard as everyone says it is. Being safe makes me happy. Ahhh, safety."
